

SEO & GEO Improvements

What changed on placelund.se — and why it matters

This document summarises the technical and content improvements made to the Place Lund Hotel website. Everything is written in plain language — no technical background needed. The goal of these changes is to help the hotel appear higher in Google search results and to be recommended by AI assistants like ChatGPT, Perplexity, and Google's AI Overviews when travellers ask questions like *"best hotel in Lund with breakfast included."*

What is SEO — and what is GEO?

SEO — Search Engine Optimisation	GEO — Generative Engine Optimisation
Getting your website to appear near the top of Google when someone searches "hotel lund" or "conference rooms lund". This has been the main goal of website optimisation for the last 20 years.	A newer challenge: getting your hotel <i>mentioned by name</i> when someone asks ChatGPT, Perplexity, or Google's AI assistant a question. These AI tools read the internet and then write a recommendation — you want to be in that recommendation.

What was changed — at a glance

#	What changed	Type	Benefit
1	AI crawlers explicitly allowed	GEO	ChatGPT & Perplexity can now read the site
2	AI indexing file (llms.txt) created	GEO	Tells AI assistants what is most important
3	Rich structured data (schema) upgraded	SEO + GEO	Google understands the hotel fully
4	Page titles updated with keywords	SEO	Clearer match for what guests search
5	FAQ page structured for AI answers	SEO + GEO	Answers pulled directly into AI results
6	FAQ question headings fixed	SEO + GEO	Search engines can extract each Q&A cleanly
7	Meta descriptions improved	SEO	Better click-through from search results

Each change explained

1. AI crawlers explicitly allowed

GEO

In plain terms:	AI assistants like ChatGPT and Perplexity send automated programs called "crawlers" to read websites so they can learn about businesses. By default, many websites accidentally block these crawlers.
What was done:	The website's robots.txt file was updated to explicitly welcome seven major AI crawlers: GPTBot (OpenAI/ChatGPT), ClaudeBot (Anthropic), PerplexityBot, GoogleOther (Google AI), and others.
Why it matters:	Without this, AI assistants may never learn about Place Lund Hotel at all.

2. AI indexing file (llms.txt) created

GEO

In plain terms:	A brand new file type, similar to a "welcome letter" for AI assistants. It tells AI systems which pages are most important and summarises key facts about the hotel — pricing, services, location — in a format AI can easily read.
What was done:	A new file was created at placelund.se/llms.txt listing all key pages with descriptions, conference room capacities, meal inclusions, parking, pets policy, and contact details.
Why it matters:	When an AI assistant reads this file, it immediately understands what makes Place Lund Hotel unique — especially that breakfast AND dinner are included, which no other 3-star hotel in Lund offers.

3. Rich structured data (schema) upgraded

SEO + GEO

In plain terms:	Behind every web page there is invisible data written in a special format that Google and AI systems can read directly. Think of it as a structured fact sheet about the business that search engines trust more than regular page text.
What was done:	The hotel's fact sheet was significantly expanded to include: star rating, exact address and map coordinates, check-in/check-out times, amenities list (including "Breakfast Included" and "Dinner Included"), payment methods, EV charging, pets policy, and a link to the hotel's Google Maps listing.
Why it matters:	Google can now display rich results (star ratings, check-in times, amenities) directly in search results without the user even clicking. This increases trust and click-through rates significantly.

4. Page titles updated with keywords

SEO

In plain terms:	Every page on a website has a main heading (called an H1). This is the single most important phrase Google uses to understand what the page is about. Headings that say things like "A Place to Stay" are poetic — but invisible to search engines looking for "hotel rooms in Lund."
What was done:	Two key pages were updated: Hotel page: "A Place to Stay" → "Hotel Rooms in Lund" Conference page: "A Place to Collaborate" → "Conference Rooms in Lund"
Why it matters:	The taglines are kept as subtitle text below — the personality is preserved, but Google now knows exactly what each page offers.

5. FAQ page structured for AI answers

SEO + GEO

In plain terms:	When someone asks Google or an AI assistant a question like "does Place Lund Hotel include breakfast?", the answer can come directly from the hotel's FAQ page — but only if that page is marked up in a way these systems understand.
What was done:	The hotel FAQ page now includes FAQPage schema — a special format that packages every question and answer in a machine-readable structure. Google can show these Q&As; directly in search results as expandable snippets.
Why it matters:	Pages with FAQ schema are cited 3x more often by Google's AI Overviews, according to recent research. This means Place Lund's answers may appear at the very top of a Google search, even above paid ads.

6. FAQ question headings fixed

SEO + GEO

In plain terms:	On web pages, headings come in levels: H1 (most important), H2, H3, and so on. Search engines and AI crawlers use these levels to understand page structure. FAQ questions were previously marked as H3 — a level that signals "minor detail."
What was done:	FAQ questions upgraded from H3 to H2 throughout the hotel FAQ page.
Why it matters:	Each question is now treated as a primary piece of information on the page. This makes it far more likely that individual answers get extracted and shown in AI-generated responses.

7. Meta descriptions improved

SEO

In plain terms:	A meta description is the short text that appears under a page title in Google search results. It doesn't directly affect ranking, but it is the first thing a potential guest reads before deciding whether to click. Short or vague descriptions miss an opportunity to convert a searcher into a visitor.
What was done:	The general FAQ page description was too short (104 characters — below the recommended minimum of 120). It was rewritten to 175 characters, now mentioning check-in times, breakfast, parking, pets, WiFi, and Lund University proximity.
Why it matters:	More informative previews → more clicks from search results.

Your competitive advantage — what the research found

As part of this project, all major hotels in Lund were analysed. A key finding emerged:

Place Lund Hotel is the only 3-star hotel in Lund that includes both breakfast AND dinner.

No competitor at the same price point offers this. First Hotel Planetstaden also includes meals — but at a 4-star premium price.

Keyword gaps to capture next:

Search phrase	Opportunity
<i>hotel lund frukost och middag ingår</i>	Swedish — virtually zero competition. Highly specific, high-intent search.
<i>hotel lund that includes dinner</i>	English equivalent — no Lund competitor targets this phrase.
<i>3-star hotel lund conference</i>	Mid-range conference seekers — Place Lund is well-positioned.
<i>lund hotel with kitchen</i>	Targets the furnished apartment guests.
<i>hotel near lund university for researchers</i>	AI query — visiting academics, long stays.
<i>weekend package lund meals included</i>	Leisure travellers comparing value — a clear win.

What happens next — and what to expect

SEO improvements take time. Here is a realistic timeline:

1–4 weeks	Google re-crawls the site and processes the new structured data. The rich data (star ratings, amenities) may begin appearing in search results.
------------------	---

4–8 weeks	Rankings for targeted keywords begin shifting. Pages with better H1 titles and FAQ schema start appearing for more specific searches.
2–4 months	AI assistants (ChatGPT, Perplexity, Google AI) begin referencing the hotel in responses to relevant travel queries.
4–6 months	Full compounding effect: keyword rankings stabilise, AI citation frequency increases, organic traffic grows.

Recommended next steps:

- Verify and update the Google Business Profile listing to match the website exactly (name, address, phone, hours).
- Add the hotel to Bing Places — this directly feeds Microsoft's AI assistant (Copilot).
- Consider writing a short webpage dedicated to "breakfast and dinner included" to target that keyword gap.
- Gather more Google Reviews — AI systems weight businesses with recent, high-volume reviews more heavily.

All code changes have been applied to the website codebase and are ready to deploy. This report was prepared by MB Studio in March 2026.
